Kaitlyn Dickinson

kaitlynjd.w@gmail.com | kaitlyndickinson.github.io | linkedin.com/in/kaitlyndickinson

Skills

Languages: Python, SQL, TypeScript/JavaScript, Java, C++
Frameworks & Libraries: FastAPI, Flask, Django, LangChain, Angular, Streamlit
Cloud & DevOps: Amazon Web Services (AWS: Athena, EC2, S3), Apache Airflow, Docker, CI/CD, Nginx
Databases & Tools: Snowflake, ChromaDB, PostgreSQL, Databricks, Git, Jira, Claude Code

Experience

RefiJet **Centennial, CO**
Software Developer 2 **09/2026 - Current**

- Working across frontend applications, backend services, APIs, lender integrations, and internal tools for a fintech company helping customers with auto refinancing. Developing features for new and legacy applications using spec-driven development.

EchoStar **Englewood, CO**
Application Developer III **12/2024 - 09/2026**

- Migrated **7+** business-critical scripts to Apache Airflow DAGs: introducing scheduling, dependency management and automated recovery where none existed and saving the team manual reconciliation.
- Built a pipeline that ingests and tracks changes in knowledge base articles, filters by metadata to isolate content and syncs to a customer service platform, exposing **1,000+** scattered knowledge articles to teams throughout the department and replacing ad-hoc data pulls.
- Replaced a manual, hardcoded outage recovery process (**100+** tickets) for a ticketing system (Angular/Django) processing **2,000+ tickets/day**, cut recovery time from hours to seconds and removed a recurring risk.

Biamp Systems **Beaverton, OR**
Software Engineering Co-Op **06/2023 - 12/2023**

- Designed and built an LLM chatbot for internal engineering teams, including an automated ingestion pipeline that parses multiple document types (including C++ source) into a vector database (ChromaDB) organized for accurate, extensible retrieval.
- Developed custom retrieval workflows and backend APIs (data retrieval, session management, user settings) that routed queries to the correct document collection, giving engineers instant answers over docs/specs and code assistance and boosting productivity.

Digimarc Corporation **Beaverton, OR**
Software Engineering Co-Op **06/2022 - 12/2022**

- Developed a C++ ELF parser on Linux and integrated with existing SDK, enhancing software security.
- Optimized a Python-based image processing pipeline on AWS SQS/EC2 by adding per-job timeouts to prevent workers from hanging on oversized files and tightening autoscaling thresholds to stop overprovisioning, cutting costs by more than **50%** and increasing throughput.

NASA Ames Research Center **Mountain View, CA**
Software Developer Intern **06/2020 - 09/2021**

- Developed the Celestial Mapping System: built on top of NASA WorldWind Java SDK, delivering **10** features in the first 3 months and taking a proof of concept to a functional application used to visualize and plan missions.
- Processed and integrated large geospatial datasets (GDAL, XML, QGIS) to support real-time rendering and analysis of planetary and lunar surface data.
- Implemented a tessellation algorithm to reduce globe distortion and improve accuracy near the poles.

Education

Bachelor's in Software Engineering Technology Oregon Institute of Technology - Klamath Falls, OR
